Care Delivery Organizations (CDOs) need savings in paper-chart-related costs... staffing, supplies, copying, printing, storage, chart-pulls ...all in a HIPAA compliant manner. Using a Document Management System (DMS) typically cuts these costs by 50 percent to 60 percent.

CDOs need improved staff efficiency...staff time currently devoted to searching for charts, making information available "any-time, any-where", etc.

CDOs need a patient-centric mechanism to index various types of charts (demographic information, dictations/transcriptions, charts, lab results, radiology

images/reports, super-bills, etc.), manage clinical workflow and quality-of-care measurement mandates across various settings and departments.

CDOs need both products and services. They require vendors whose services include training, maintenance, help desk, disaster recovery, and product upgrades...vendors that can break a DMS implementation down into small manageable steps:

- Installation
- Customization
- Workflow re-engineering
- Training
- Outsourced services

CDOs need ...

Clinicio™—CliniDocs is an automated internet based electronic Document Management System (DMS) with rich features for archiving, managing, indexing and retrieving documents.

Clinidocs Enterprise Edition comprises of products/tools/services for digitization, scanning, workflow management, optical character recognition

(OCR), image conversions, document archival and search, email data management, etc. to reliably capture, store and provide access to lifetime patient information across multiple points of care in a HIPAA compliant manner.

Clinidocs is customizable in functionality, personalized in access and workflow driven to ensure efficiencies. Available as a standalone product it can be integrated into an End-to-End Integrated HIM platform.

**CliniDocs . . .**

Creates a centralized electronic patient-centric repository of medical documents

Allows secure management of patient-level folder hierarchy for each medical information domain

Provides an accurate, reliable bar-coding mechanism to allow automatic patient and folder-level indexing.

Allows collation and indexing of documents via keywords / metadata like Patient name, MRN, information domain, medical concepts, etc.

Provides conversion of chart images into text using powerful OCR engine and ICR engine.

Imports and integrates over 150 electronic document formats (like word-processor, spreadsheet, PDF, text, email, image, XML, etc).

Provides version control mechanism to ensure change tracking and HIPAA required audit trail of access.

Provides powerful full-text search using a browser-based interface.

**CliniDocs . . .**

Provides for multi-user role-based access privileges for CDO users at user and group levels

Allows viewing documents without requiring native application installed (e.g. view MS Word document without MS Word installed on desktop).

Provides extensive page-based navigation on documents stored.

Allows sharing of documents over LAN/Internet making information accessible "anytime, anywhere".

Provides comprehensive electronic clinical workflow management.

Allows rich annotation of documents.

Provides E-Forms processing with auto-recognition using OCR/ICR/OMR/barcode engines.

**CliniDocs . . .**

Built on Microsoft .NET and compliant with standards such as ODMA and XML provides, is highly scalable due to its distributed component based architecture

Is highly available to manage disaster recovery and fault tolerance.

Deployable on popular relational database management systems like MS SQL Server and ORACLE.

Provides extensive backup and recovery features to ensure safety of medical records.

Supplemented by outsourced services for:

- Scanning and digitization
- Forms processing
